

# Reconfigurable High-Capacity Optical Transmitter

Mohammad R. Chitgarha, Salman Khaleghi, Amir M. Ariaei, Morteza Ziyadi, Ahmed Almainan, and Alan E. Willner

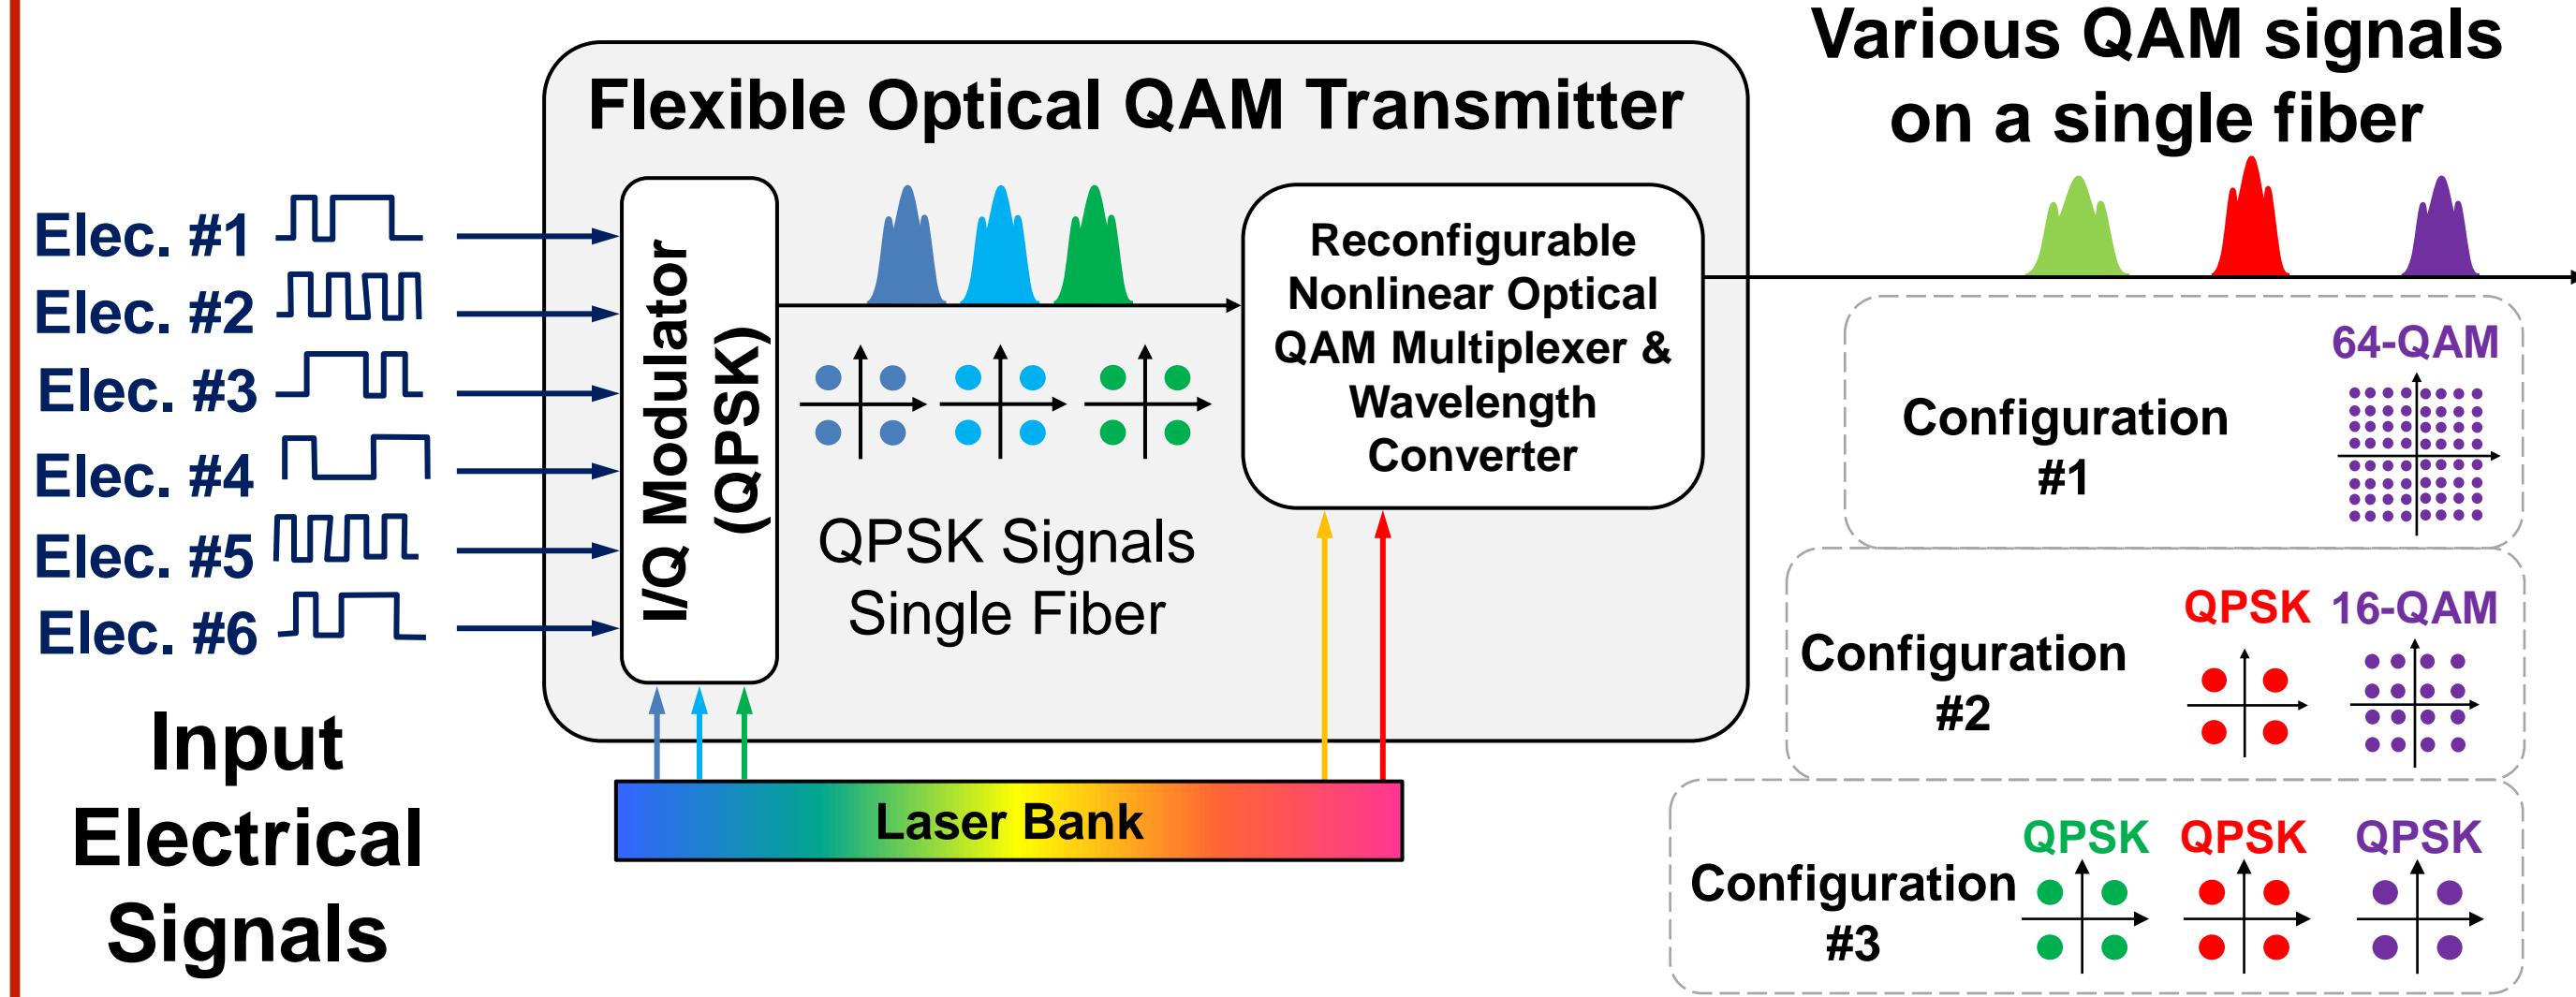

Electrical Engineering/Communication

## Higher-Order QAM Generation

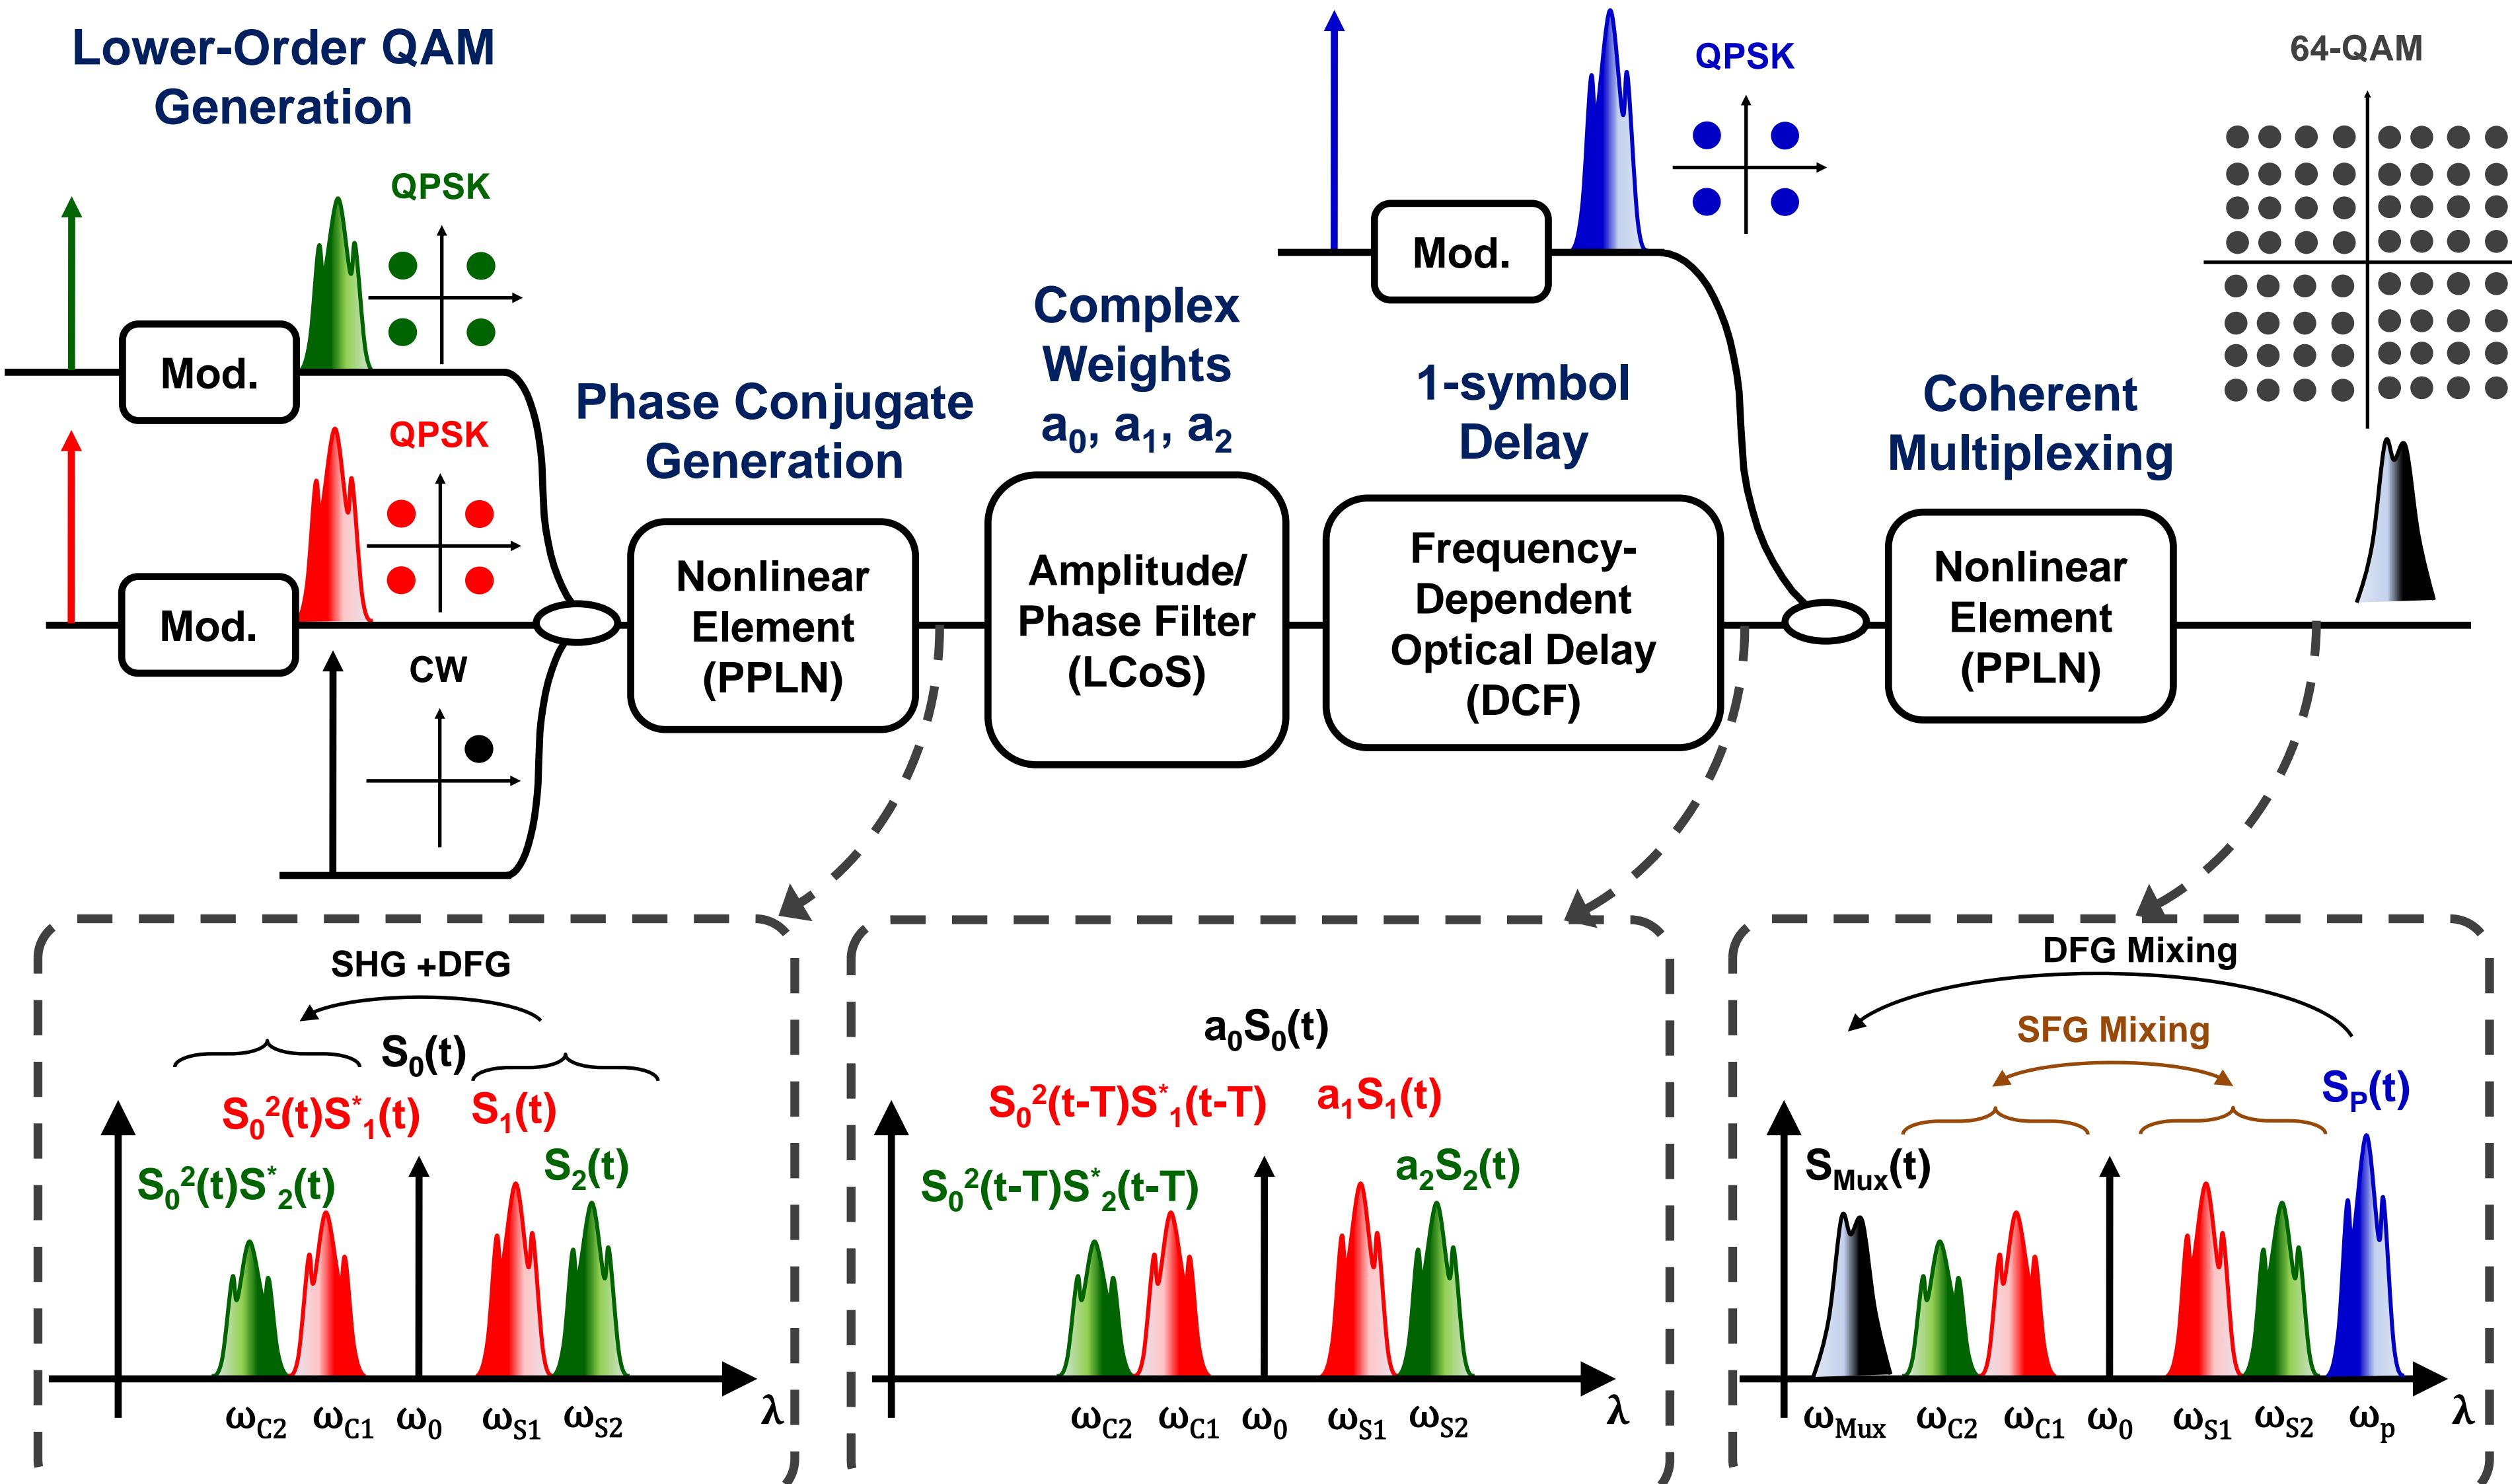

- The linearity and the speed of electronics limit the size of optical data constellations.
- Using existing DACs and RF amplifiers to generate extremely **high number of amplitude/phase symbols** at **high baud rate** is not efficient and cost effective.
- Optical nonlinear processes enable high-capacity transmitter and flexible bandwidth allocation.

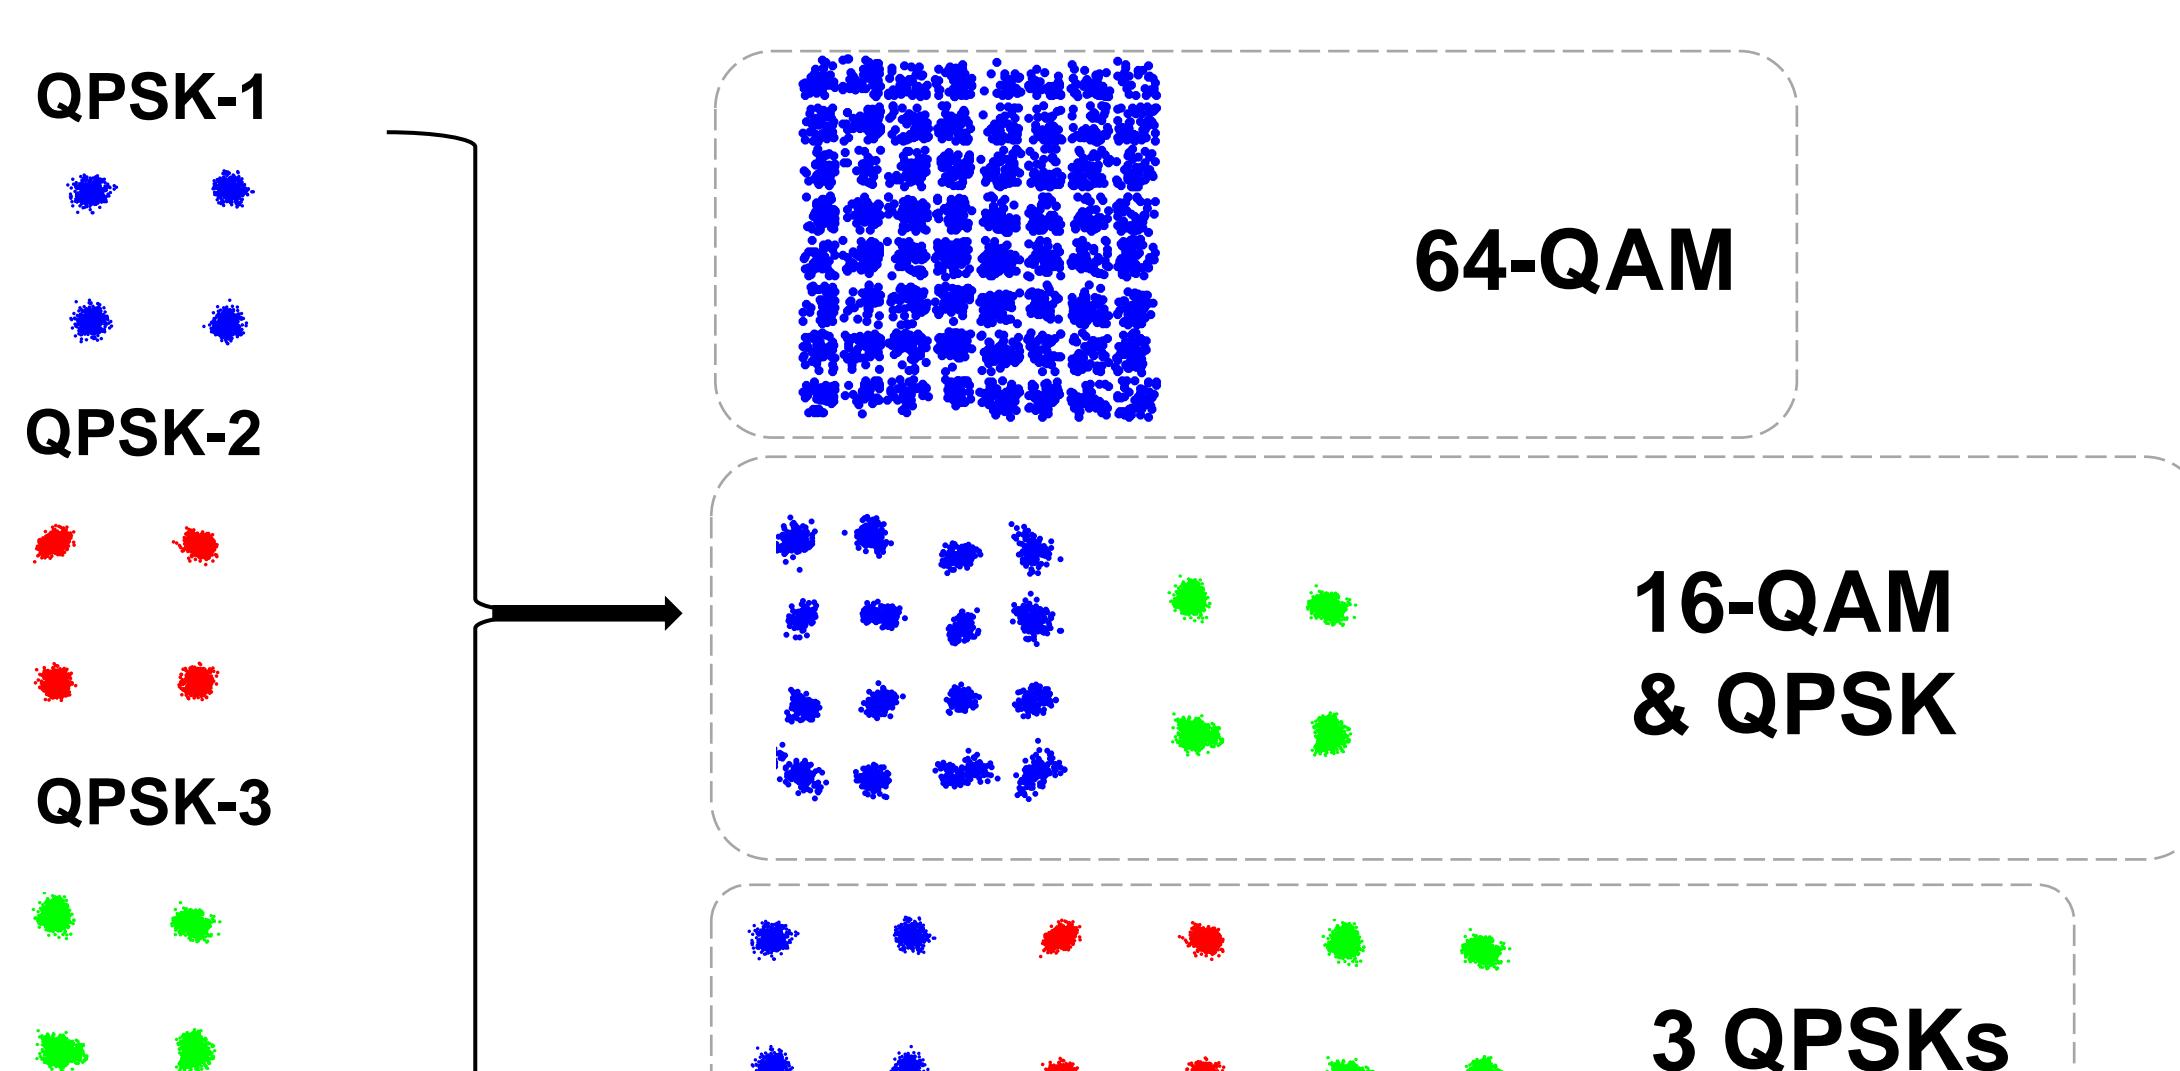

## Reconfigurable and Flexible Optical Transmitter

## Multiplexing of Multiple Lower-Order QAM Signals to a Single Higher-Order QAM

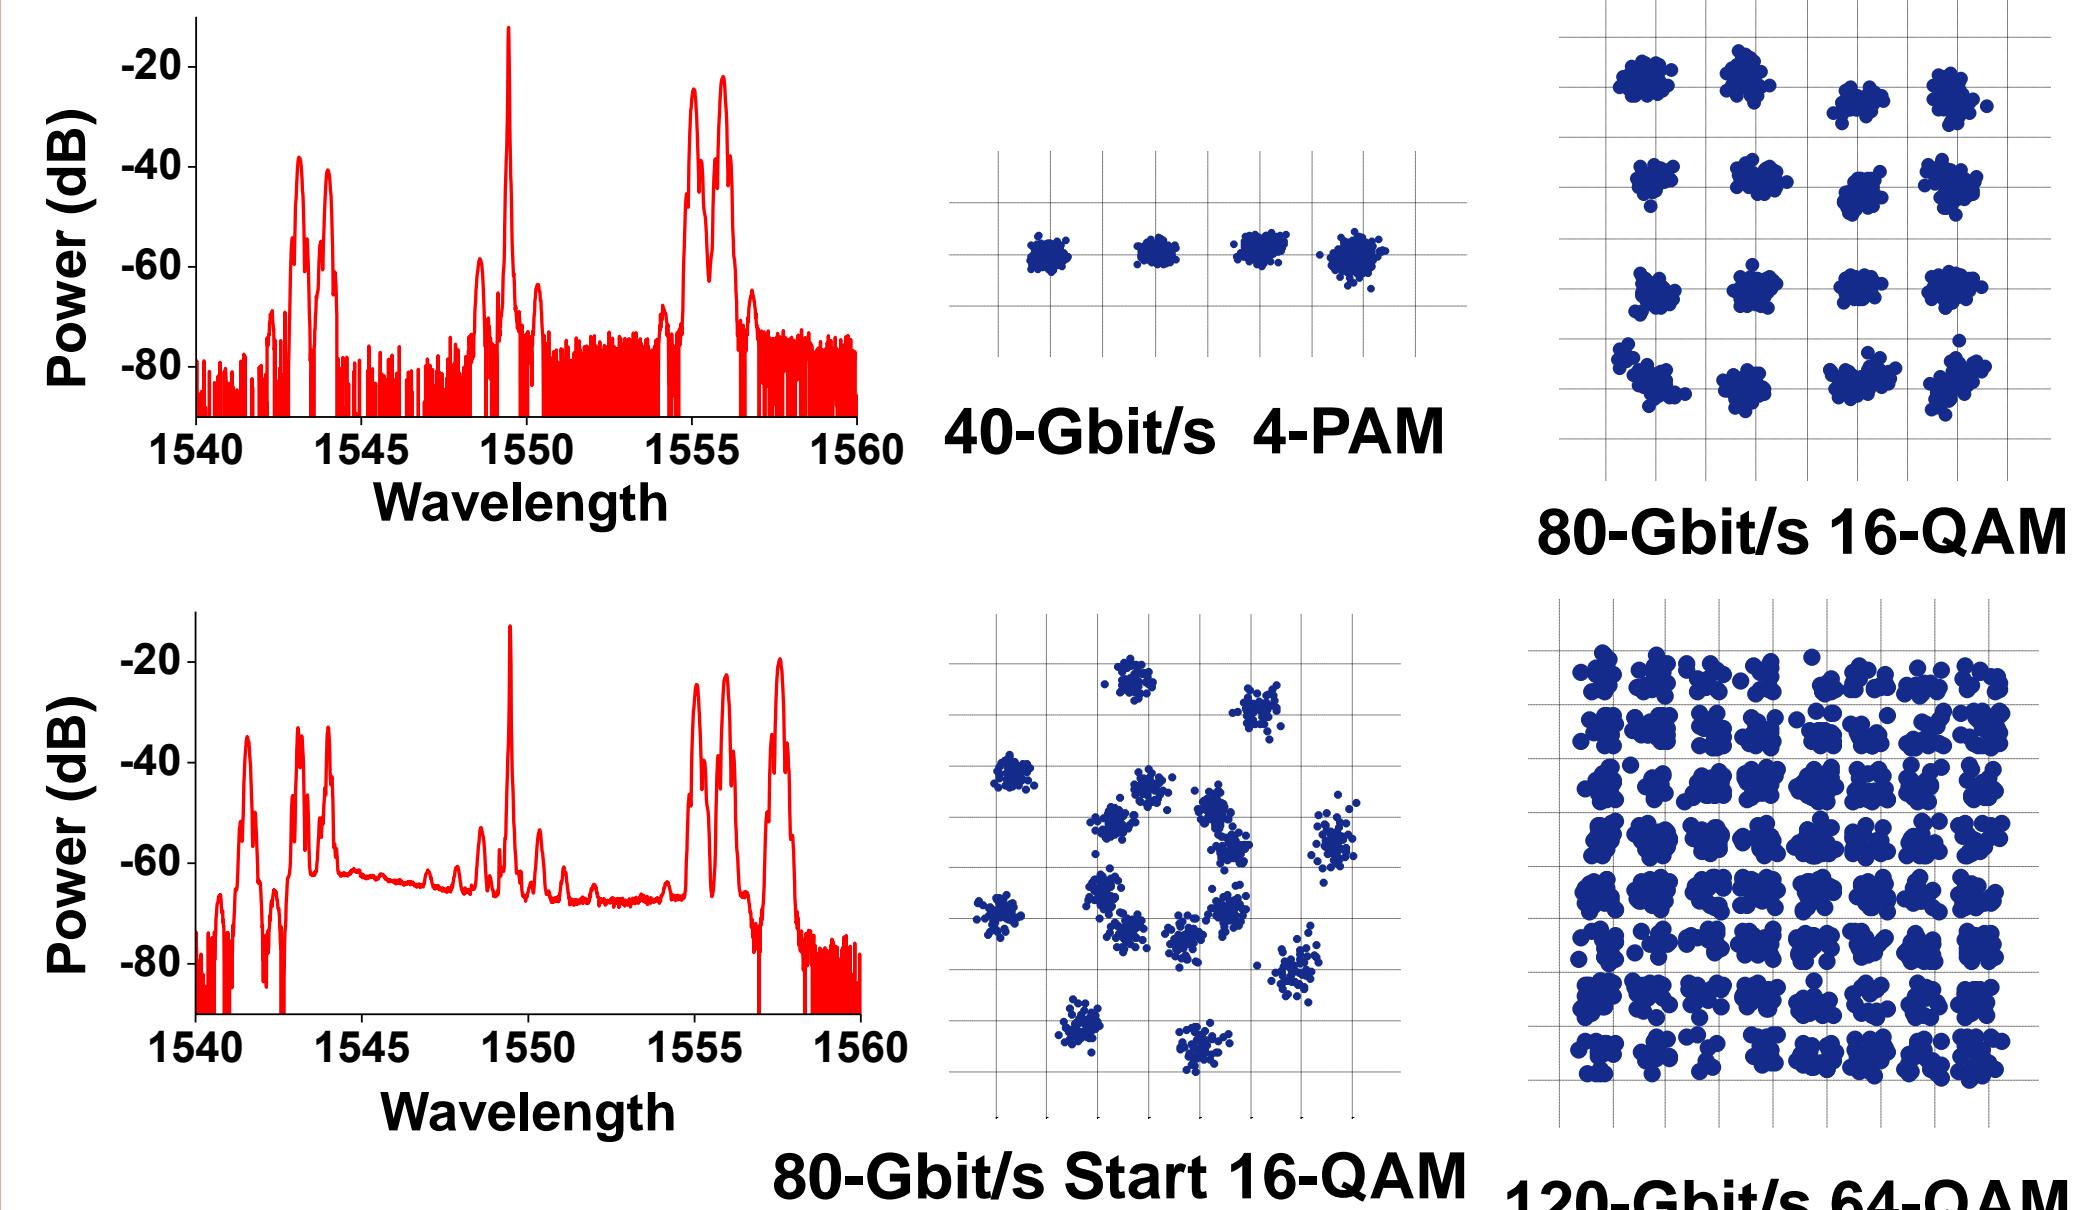

## Flexible Bandwidth Allocation
