

Diversity Benefits in Multi-System Sequence Classification: Case Study of Automatic Speech Recognition (ASR)

Kartik Audhkhasi

Advisor: Prof. Shrikanth S. Narayanan

Signal Analysis and Interpretation Lab (SAIL)

What is Sequence Classification?

“Raw” Signal

Speech

Video, Motion capture

Biomedical sensors

Weather patterns

Economic patterns

...

“Useful” label sequence

Words

Action events

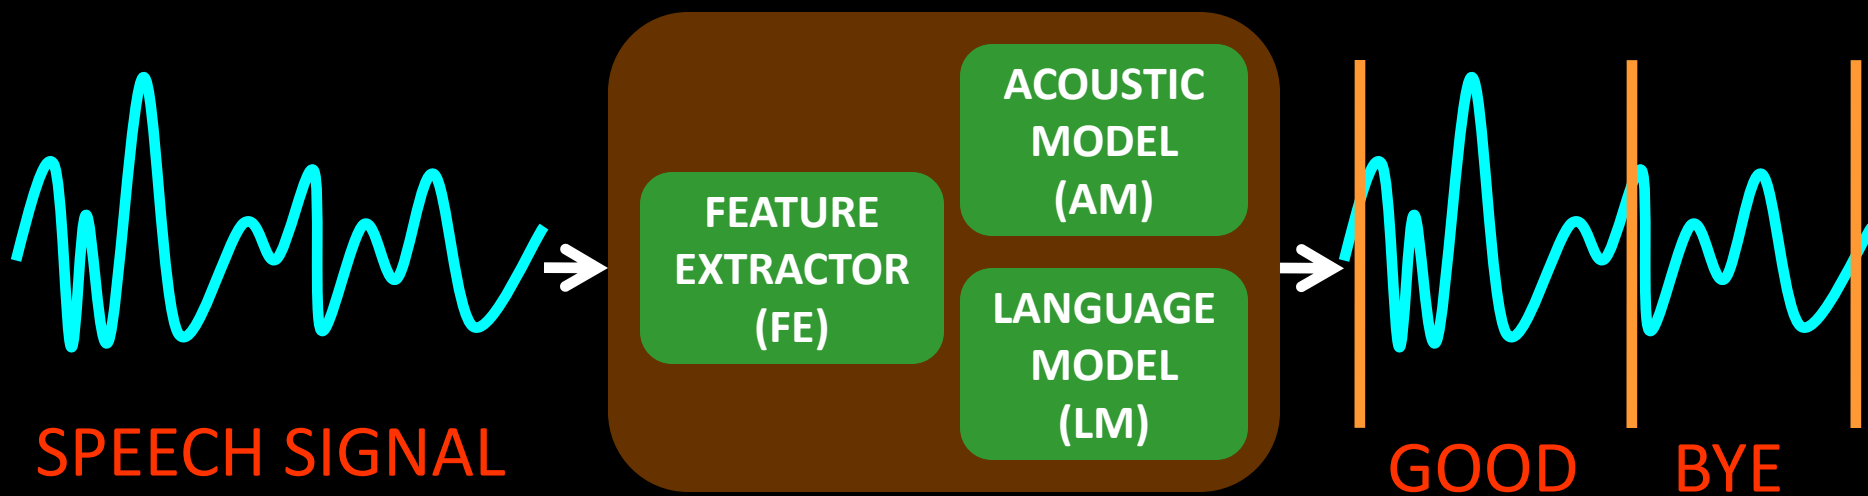

Medically-abnormal events

Heat-waves

Bearish/bullish trend

...

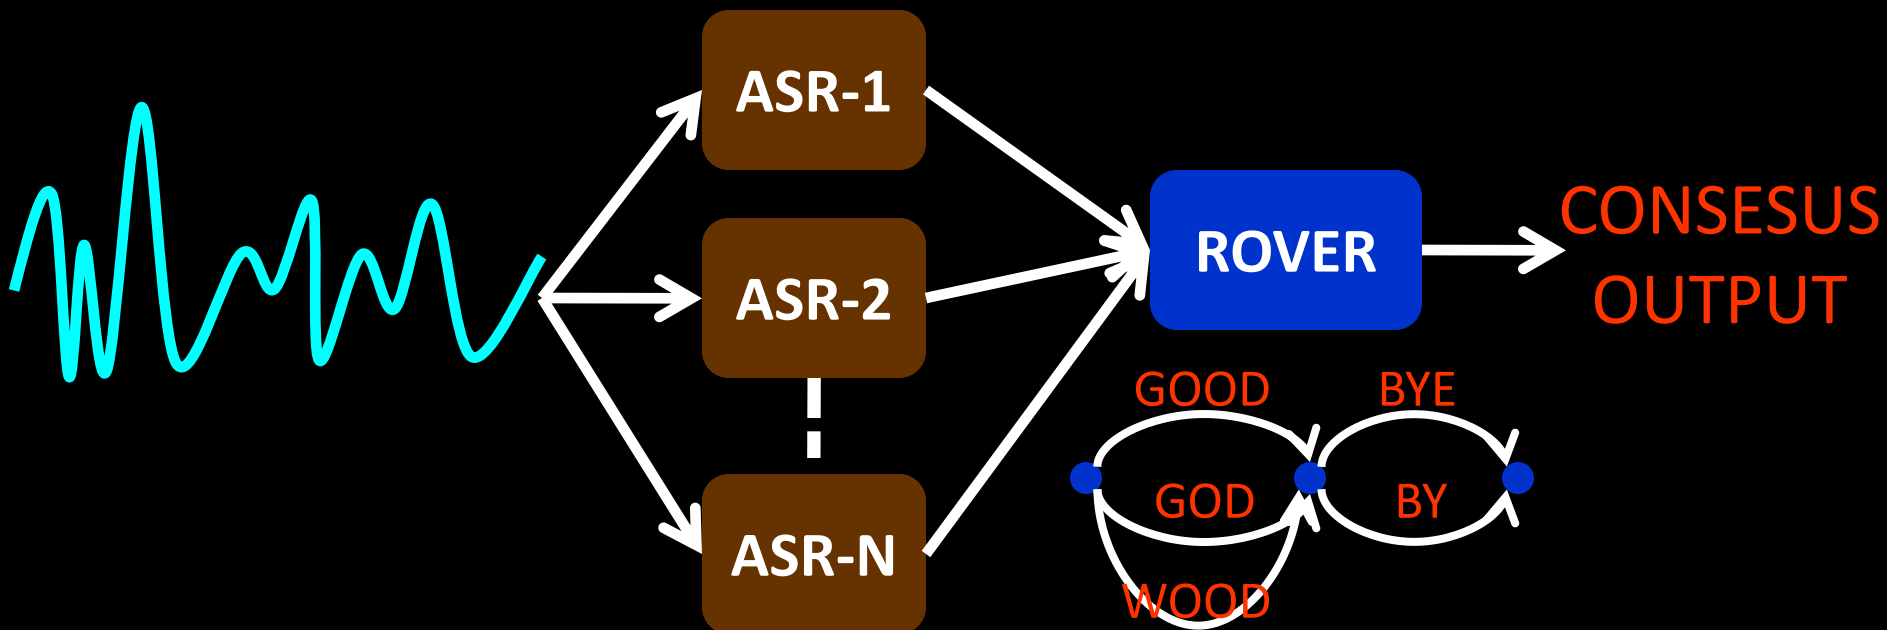

What Do “Textbook” ASR Systems Contain?

- FE - human speech signal processing.
- AM - statistics of speech features.
- LM - statistics of text.

There are **multiple models in literature** for FE/AM/LM.

What do State-Of-The-Art ASR Systems Contain?

- Fusion of multiple diverse ASRs is performed in all large-scale ASR projects by major ASR research groups.

Design Strategy: Train diverse ASRs separately and hope fusion helps!

My Research Contributions

- 1) Defined ASR system diversity and proved its link with fusion performance as an upper-bound.

LEVENSHTEIN STRING

EDIT DISTANCE

$$E(\text{ref. sent.}, \text{fusion output}) \leq \frac{1}{N} \sum_{i=1}^N E(\text{ref. sent.}, \text{hyp. sent. } i)$$

$$- \frac{1}{N} \sum_{i=1}^N E(\text{fusion output}, \text{hyp. sent. } i) + \text{constants}$$

DIVERSITY FOR N ASRs

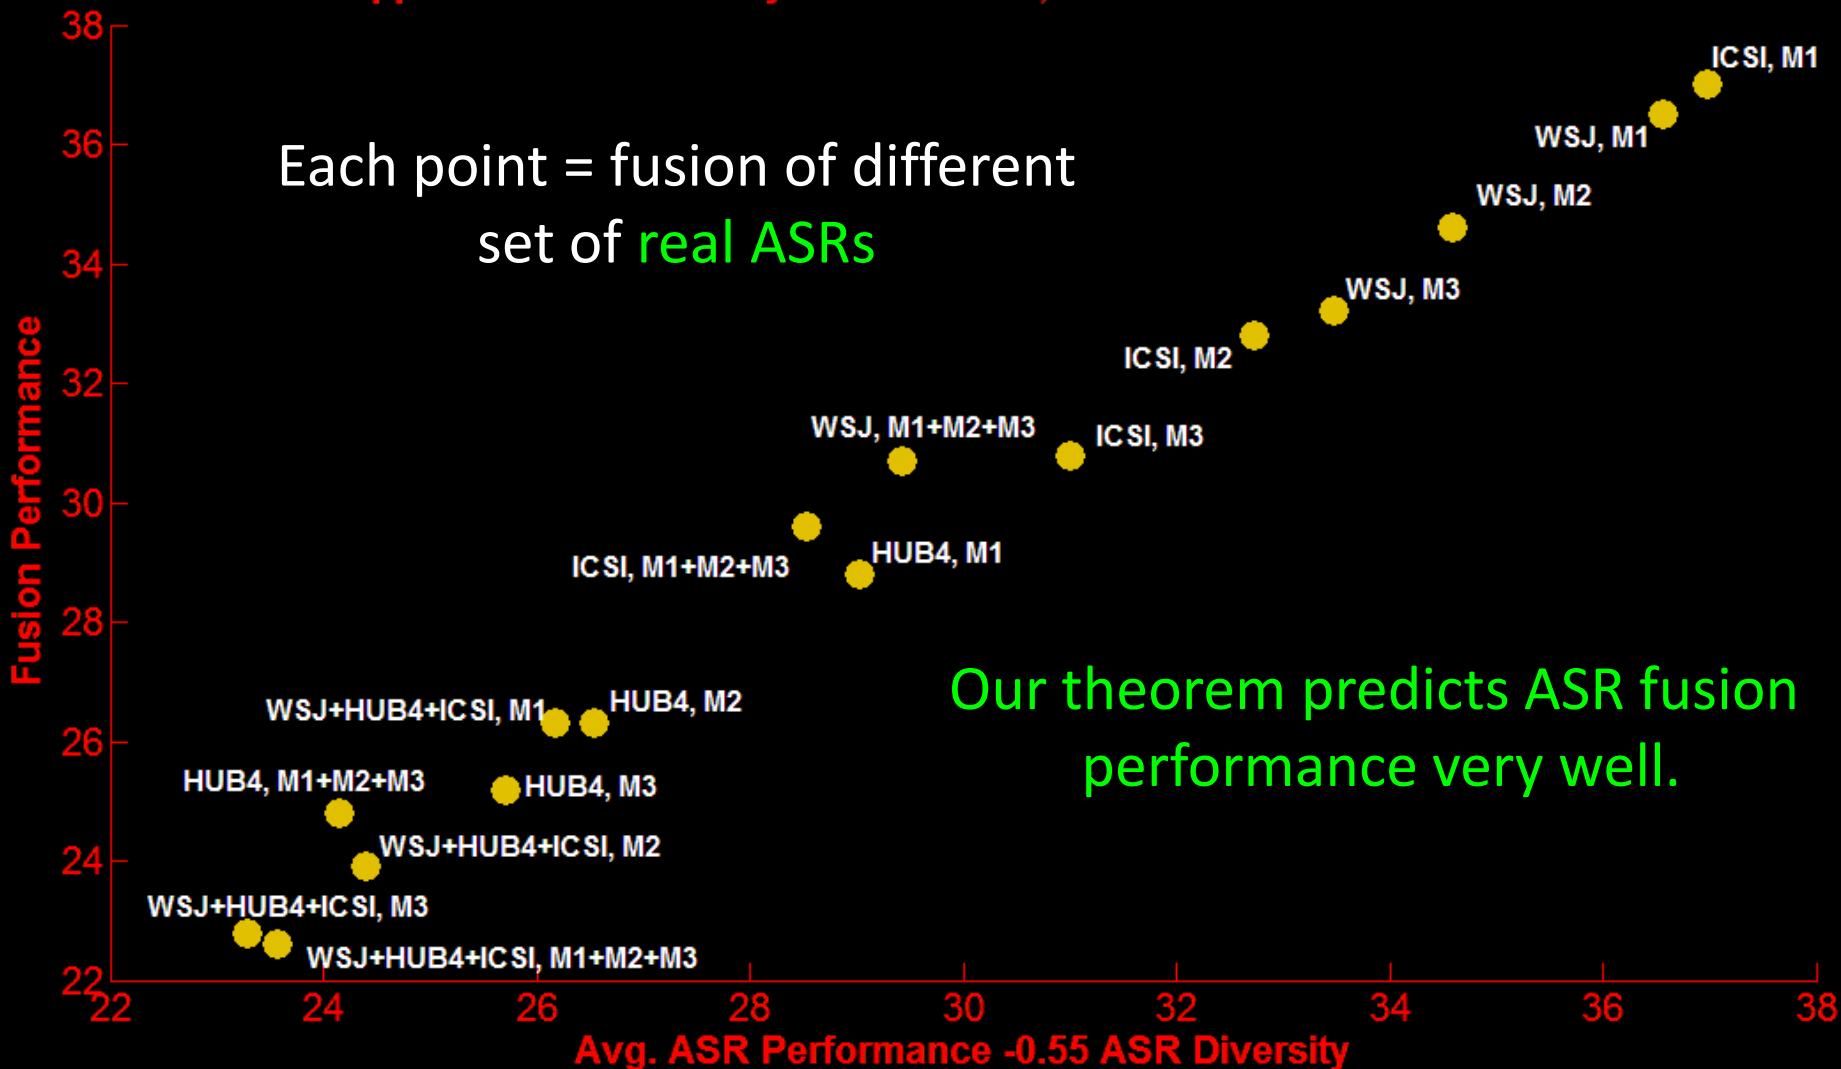

AVG. PERFORMANCE
FOR N ASRs

- [2] K. Audhkhasi, A. Zavou, P. Georgiou, S. Narayanan, "Empirical link between hypothesis diversity and fusion performance in an ensemble of automatic speech recognition systems", Proc. Interspeech, 2013.

My Research Contributions

Approximation Accuracy: RMSE = 0.57, Correlation Coefficient = 0.99

Each point = fusion of different set of **real ASRs**

Our theorem predicts ASR fusion performance very well.

My Research Contributions

2) Recent approaches for **training diverse ASR systems**:

- Minimum Bayes Risk Leveraging (MBRL) [Breslin2006]
- Complementary Phone Error (CPE) Training [Diehl2012]
- Diverse Maximum Mutual Information (DMMI) Training [Tachioka2013]

are all **special cases of**:

$$\min \left\{ \frac{1}{N} \sum_{i=1}^N E(\text{ref. sent.}, \text{hyp. sent. } i) - \frac{\gamma}{N} \sum_{i=1}^N E(\text{fusion output}, \text{hyp. sent. } i) \right\}$$

Minimizing upper-bound on fusion error rate leads to
Diverse Minimum Bayes Risk (DMBR) Training

My Thesis Research

“A Computational Framework for Ensembles of Diverse Experts”

Modeling

What is a realistic statistical model for a system of diverse human/machine experts?

*Globally-Variant
Locally-Constant
(GVLC) Model*

Analysis

How does ensemble diversity affect fusion performance?

*Generalized
Ambiguity
Decomposition (GAD)*

Design

How do we design ensembles of diverse experts?

*Diverse MaxEnt
models and ASR
systems*
